TITLE: Stereospecific polymerization of butadiene in the presence of pi-allylic complexes

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 6, no. 12, 1964, 2202

TOPIC TAGS: polymerization, butadiene, catalysis, macromolecular chemistry

Abstract: It was shown that the polymerization of butadiene in benzene solutions under the influence of catalytic systems based on pi-allylic complexes of nickel and metal halides (TiCl4, VCl4, WCl6, AlBr3, and NiCl2) leads to the formation of a polymer with predominantly (up to 94%) cis-1,4-units. The stereospecificity of these catalysts does not depend on the nature of the metal in the Lewis acid. The polymerization temperature was 20-50° and the time 8-15 hours.

TITLE: Stereospecific polymerization of butadiene by catalytic systems based on the  $\pi$ -allyl nickel complexes

SOURCE: AN SSSR. Doklady, v. 161, no. 3, 1965, 583-585

TOPIC TAGS: polymerization, butadiene, stereospecificity, nickel organic compound, catalyst

ABSTRACT: The stereospecific catalytic effect of bis-( $\pi$ -crotyl) complexes of nickel in the polymerization of butadiene was investigated and compared with the effect of  $\pi$ -allyl-Ni complexes. The catalyst was obtained by treating bis-( $\pi$ -crotyl)-Ni with Ni-halides in a ratio of 1:2. It was found that the catalysts cause the formation of 1-4 polybutadiene, consisting mainly (up to 95%) of cis-1,4-rings, and that the more effective catalysts form in the presence of  $TiCl_4$ . The bis-( $\pi$ -allyl)-nickel-bromide catalyst caused the formation of polymers in which the number of cis-rings is equal to that of trans-rings, with the formation of 1, 2-rings being negligible. Addition of metal halides to bis-( $\pi$ -allyl)-nickel-bromide and to bis-( $\pi$ -crotyl)-

nickel-chloride increased the catalytic activity and altered the stereospecificity. All of the polybutadienes formed contained up to 92% cis-1, 4-rings. The structure of the polymer was practically independent of the nature of the metal halide. Orig. art. has: 3 tables and 1 formula.

TITLE: Stereospecific polymerization of butadiene in the presence of catalyst systems based on  $\pi$ -cyclopentadienyl complexes of nickel

SOURCE: AN SSSR. Doklady, v. 161, no. 4, 1965, 836-838

TOPIC TAGS: stereospecific polymerization, polymerization, butadiene polymerization, butadiene, pi-complex

ABSTRACT: Polymerization of dienes was studied with catalyst systems composed of  $\pi$ -cyclopentadienyl Ni-complexes and Lewis acids. These systems represent a new group of stereospecific polymerization catalysts as they do not contain compounds with a  $\sigma$ -metal-hydrocarbon bond. Benzene solutions of bis- $\pi$ -cyclopentadienyl Ni-complex and  $\pi$ -cyclopentadienyl- $\pi$ -cyclopentenyl Ni-complexes along with metal halides are effective catalysts for polymerization of butadiene. The solutions of Ni-complexes and of metal halides were prepared separately and were mixed together in an argon atmosphere. Polymerization experiments were carried out at 50°C and

Card 1/3

L 52264-65

ACCESSION NR: AP5010832

the test duration was 17 hours. Butadiene concentration in the total solution was 2.5 mol/l and concentration of metal halides was  $5 \times 10^{-3}$  mol/l. Polymers were precipitated with HCl acidified ethyl alcohol. The yield and molecular weight of the polymers is a function of the type of Lewis acid used and the ratio between individual components of the catalyst system. A  $(\pi\text{-C}_2\text{H}_5)_2\text{Ni-TiCl}_4$  catalyst system yielded a polymer containing about 90% cis-1,4 groups, 5 to 10% trans-1,4 groups, and no side vinyl groups. Highest polymer yields were obtained with a Ni:Ti ratio of 1. The polymer molecular weight was not higher than 100,000. The  $(\pi\text{-C}_2\text{H}_5)_2\text{Ni-VCl}_4$  catalyst system yields polybutadiene containing up to 96% cis-1,4 groups. Maximum catalytic activity results from a Ni:V ratio of 1, the molecular weight of the polymer is 400,000 to 500,000. The catalyst based on tin-, molybdenum-, and tungsten halides yield polymers with 20 to 50% trans-1,4 groups. Depending upon reaction conditions,  $(\pi\text{-C}_5\text{H}_5)_2\text{Ni-ALX}_3$  catalysts (where X is Cl or Br) yield polybutadiene of 20,000 to 50,000 molecular weight. Catalysts based on  $\pi$ -cyclopentadienyl- $\pi$ -cyclopentenyl Ni-complexes perform similarly to bis- $\pi$ -cyclopentadienyl based systems; both yield polybutadiene containing 92-95% cis-1,4 groups. "The authors are highly indebted to I. G. Kolokoltseva for synthesis of the bis- $\pi$ -cyclopentadienyl Ni-complex." Orig. art. has: 2 tables.

ABSTRACT: This Author Certificate presents a method for obtaining cis-1,4-polybutadiene rubber by thermal polymerization of butadiene in the presence of a catalyst. The catalyst consists of tetranickelcarbonyl and metal-containing compounds. The metal-containing compounds used are transition metal salts of group V or VI soluble in hydrocarbons, for instance, vanadium tetrachloride, vanadium

TITLE: Polymerization of butadiene by catalysts based on the metal-carbonyls of group VIII metals in periodic table of elements

SOURCE: AN SSSR. Doklady, v. 165, no. 1, 1965, 95-98

TOPIC TAGS: polymer, polymerization, catalytic polymerization, butadiene, nickel compound, cobalt compound

ABSTRACT: The effect of nickel and cobalt carbonyls  $Ni(CO)_4$ ,  $Co_2(CO)_8$ ,  $(C_5H_5NiCo)_2$  on the polymerization of butadiene in the presence of different Lewis acids and of  $AlX_3$ ,  $AlBr_3$ ,  $TiCl_4$ ,  $TiBr_4$ ,  $TiI_4$ ,  $VCX_4$ ,  $VOCl_3$ ,  $MoCl_5$ , and  $WCl_5$  was studied. The polymerization was carried out in benzene or heptane solutions at a temperature of 50°C over a period of 17 hours. The yield of polymer and its microstructure in terms of the fractions of cis- and trans-butadiene monomers in the chain are tabulated. It was found that the catalytic activity of the metal carbonyls and the stoichiometry of the reaction depend on the nature of the Lewis acid. A suggestion is made that the catalytic systems studied here are related to  $\pi$ -allyl and  $\pi$ -cyclopentadienyl nickel.

35  
BTITLE: Some regularities in the change of the molecular weight distribution of cis-1,4  
polybutadienes obtained under the influence of Ziegler-Natta catalysts

SOURCE: AN SSSR. Doklady, v. 169, no. 4, 1966, 832-834

TOPIC TAGS: polybutadiene, catalytic polymerization, molecular weight, titanium com-  
pound, organoaluminum compound

ABSTRACT: The complex Ziegler-Natta catalyst  $TiI_4 + Al(iso-C_4H_9)_3$  was used to synthesize cis-1,4-polybutadienes. The effect of the degree of conversion of the monomer, concentration of the catalyst  $TiI_4 + Al(iso-C_4H_9)_3$  and polymerization temperature on the molecular weight and molecular weight distribution (MWD) of the polymers formed was studied. The MWD was determined from sedimentation rates in a "Phywe" centrifuge. Samples obtained at various stages of polymerization at 25°C showed that independently of the degree of conversion of the monomer, beginning with the smallest experimentally measurable degree of conversion (~15%), the MWD of the polymers does not change, i. e., the process is a steady one. The catalyst and monomer concentrations do not affect the steadiness of the process. The latter is affected, however, by a

Card 1/2

UDC: 66.095.265+678.744

L 05129-67

ACC NR: AP6027734

drop in the polymerization temperature to 15°C, and in this case the molecular weight increases with the degree of conversion. The molecular weight of cis-1,4-polybutadienes increases with the initial concentration of the monomer and with decreasing initial concentration of the catalyst. As the temperature drops, the nature of the change in molecular weight as a function of these two concentrations remains the same. It is concluded that the polymerization of butadiene over  $TiI_4 + Al(iso-C_4H_9)_3$  at 15°C and below involves the "live"-chain mechanism, whereas at higher temperatures an increasingly important role is played by chain-limiting reactions. Orig. art. has 4 figures.

TITLE: The effect of the composition of rhodium(III) complexes on their  
catalytic activity in the process of stereospecific polymerization of  
butadiene-1,3 in an aqueous medium 4456

SOURCE: AN SSSR. Doklady, v.167, no.1, 1966, 99-101

TOPIC TAGS: rhodium compound, polymerization catalyst, butadiene,  
aqueous solution

ABSTRACT: The complexes to be investigated, synthesized by known meth-  
ods, were analyzed for their rhodium and halide content. The polymeri-  
zation was carried out by methods described in a previous article. A  
table shows results of using fifteen different rhodium complexes as  
catalysts in the polymerization of butadiene in an aqueous emulsion at  
50 and 70°C. It follows from these results that the gradual replacement  
Card 1/2 UDC: 66.095.264:678.672:661.897 2

L 23110-66

ACC NR: AP6009488

of chlorine ions by ammonia molecules leads to a decrease in the polymerization rate. The catalytic activity of bromine derivatives also decreases with an increasing accumulation of ammonia molecules in the inner sphere of the complex. Comparison of the catalytic effect of the halides of rhodium shows that the chlorides and the bromides of rhodium have almost identical catalytic ability and stereospecificity. The iodide is inactive at 50°, while in its presence at 70° there takes place a polymerization process of the free radical type. With the presence of three ammonia molecules in the inner sphere of the iodide the polymerization proceeds by a coordination-ionic mechanism. Results also show that the stereospecific polymerization of butadiene in the presence of the  $Rh^{3+}$  complexes studied leads to the formation of trans-1,4-polybutadiene, regardless of the number and nature of the bonds. Orig. art. has: 1 figure and 1 table.

1211. Bond strength of tread and breaker rubber stocks under repeated deformation. I. A. LKVIN, Yu. G. KORABEV, A. E. KORNEV, and B. L. BABITSKIY. Prochnost Styazh . . . , 1954, p. 73-83. (Yezh. Khim. Obshch. im. D. I. Mendeleeva, Dec. 1954). Multi-ply cylindrical test-pieces with a diagonal joint, forming a tread-breaker-tread system, are tested on the MMS-1 machine, which subjects the test-piece to cyclic compression at high velocity with a constant initial load being applied also. The bond strength increases on treating the rubbers with the bonding agent, increasing the thickness of the breaker strip of natural rubber, and increasing the period of vulcanisation and the content (within certain limits) of sulphur and accelerator. The bond strength decreases when the period of plastication and of previous heating at 100°C are increased. The tread-rubber referred to is SKS.30A, the breaker rubber natural rubber or SKB. 45.

ABSTRACT:

Mono- and diethanolamine in various molecular proportions were brought into reaction with **phthalic anhydride**. In table 1 the probable chemical formulas, the molecular proportions, and the specific weights are shown for the obtained compounds "monoetal" (neutral **phthalic** salt of the monoethanolamine), "monokietal" (acidic salt of the same compound), "dietal" (neutral **phthalic** acidic salt of the diethanolamine) and "dikietal" (acidic salt of the same compound). The reaction of these compounds as accelerators for the vulcanization was investigated; the vulcanized products were tested with regard to their mechanical properties (**Table 2**, Figs 1-4). The values determined correspond to the standards, so that the diphenylguanidine, which at present is used as accelerator for the vulcanization and is short in supply, could easily be substituted by the

pp 410-411 (USSR)

ABSTRACT: Mono- and diethanolamines with mercaptobenzothiazol and phthalic anhydride as vulcanization activators are studied here. The derivatives of phthalic anhydride and ethanolamine are easily dissolved in water, but the activators of the composition: monoethanolamine-captax and diethanolamine-captax are decomposed by water. Monoethanolamine-captax is the most efficient activator; it is cheap and available in large quantities. The salts of the orthophthalic acid with mono- and diethanolamine are activators, the activity of which is increased in combination with captax. The mentioned activators may easily be prepared in every rubber plant.

TEXT: The production and properties of a number of vulcanization accelerators are described, namely salts of mono- and diethanolamines with mercaptobenzothiazol (I) and acid and neutral salts of these ethanolamines with orthophthalic acid (II). Monoethanolamine salts with I (III) and diethanolamine salts with I (IV) are more effective than I. With III and IV the time taken to attain optimum vulcanization is reduced by 30 % and the rubbers are 50 % stronger than standard rubber with I and are somewhat superior with regard to strength and specific elongation to rubbers with I + diphenylguanidine (V). III gives the rubber a better resistance to heat aging, while compounds with III are less subject to scorching than are

Card 1/2

New vulcanization accelerators...

B168/B101

compounds with a combination of I + V. Accelerators of type II are most effective in conjunction with I. Compounds with II are less subject to scorching, especially in comparison with those with I + V. All the above-mentioned accelerators are very cheap and readily available. TITLE: Water-soluble agents of the vulcanizing group of latex mixtures

PERIODICAL: Kauchuk i rezina, no. 3, 1961, 30-32

TEXT: The authors have attempted to produce a new, easily water-dispersible vulcanizing agent and water-soluble vulcanization activator in view of the fact that both zinc oxide and sulfur are poorly dispersible in an aqueous medium and the special pastes manufactured to prevent this drawback are not stable enough. The products of interaction of sulfur and commercial mono- and triethanolamines were tested as vulcanizing agents (L. Ye. Vinitiski, B. L. Babitskiy, et al. - Ref. 4: Trudy NIKhIMP, no. 7, KOIZ, 1958). The products of monoethanolamine and sulfur proved to be very weak vulcanizing agents. Figure 1 shows the properties of the experimental latex films produced, containing triethanolamine sulfides. The zinc salts of oleic, stearic, acetic and sulfuric acids, as well as the zinc-ammonium complexes, were investigated as vulcanization activators of latex mixtures. The results of the physico-mechanical tests of the obtained films showed that zinc

Water-soluble agents of the...

oleate and stearate solutions in triethanolamine had a weak activating effect on latex vulcanization. Zinc acetate and zinc sulfate introduced into the latex mixture in the form of aqueous solutions proved to be effective activators of the vulcanization accelerators of natural latex. An important disadvantage of these solutions is the coagulating effect on the latex due to the acidic nature of the salts. The introduction into the latex of 34 - 49% ammonium solutions of zinc sulfate as an activator of vulcanization and containing zinc in the mixture within the limits of 0.40 - 0.65 w.p. to 100 w.p. of rubber substance of the latex leads to the formation of films exceeding in some cases the tear-resistance and elasticity of standard films. The results of the physico-mechanical tests of the latex systems containing instead of zinc oxide solutions of the zinc compounds tested are given in Figure 2. The investigated new ingredients of the vulcanizing group (zinc-ammonium complexes and triethanolamine sulfides) contain substances, which stabilize the latex ammonium and triethanolamine. Their application might need, therefore, correction of the composition and the technological conditions. The authors summarize by stating that the products of interaction of sulfur and triethanolamine obtained at 100°C are effective vulcanizing agents for latex mixtures easily dispersed in an aqueous-alkaline medium. The zinc-am-

monium complexes produced by the dissolution of zinc sulfate in aqueous ammonium as activators of vulcanization of latex mixtures yield vulcanizates corresponding to the standard ones in their mechanical properties. When replacing the sulfur in latex products by triethanolamine sulfides and zinc oxide by zinc-ammonium complexes the need to prepare a sulfur and zinc paste no longer exists. TITLE: Dielectric properties of reclaimed rubber and its vulcanizates

PERIODICAL: Kauchuk i rezina, no. 12, 1962, 18 - 22

TEXT: Investigation results are submitted of the dielectric properties of reclaimed rubber and its vulcanizates. The possibilities for improving these properties are discussed. Reclaimed serial rubbers produced by reprocessing domestic tires were found to be superior to tire rubbers in their electro-insulating properties (GOST 6433-52). The specific volumetric electrical resistance of the reclaimed rubber is equal to that of the "pure" rubbers. The high electro-insulating properties of reclaimed rubber are also noted in its vulcanizates. The latter are inferior, however, in their electric spark-over resistance and the dielectric loss value. Both, filled and non-filled reclaimed vulcanizates are not inferior to electro-insulating "pure" rubbers in their mechanical characteristics, satisfying the GOST 2068-61 conditions for insulating rubber of electric cables, lines and cords. The electric tensility can be raised, while maintaining a high specific electrical resistance, by introducing a specially selected

Card 1/2

Dielectric properties of...

S/138/62/000/012/006/010  
A051/A126

combination of carbon blacks and softeners. The high electric properties are explained by the large amounts of softener in the reclaimed rubber. The electrical resistance, on the other hand, depends also on the mutual relation of softener to carbon black dosage. Comparisons were made of the dielectric and mechanical properties of reclaimed rubbers produced by different reclaiming methods: water-neutral, thermo-mechanical, and dispersion. The initial protective rubber used was the CKC -30 APM -15 (SKS-30 ARM-15). With an increase in the degree of material destruction reached during the reclaiming process, the electrical tenacity and resistance are increasing while the mechanical properties are dropping. The presence of a softener raises the dielectric properties, as it encases the filler particles, "separating" them and preventing the formation of current-conducting carbon black structures. It weakens inter-molecular interaction. Dielectric tests showed that, by selecting the appropriate composition, rubbers based on the reclaimed material can be produced with high electro-insulating properties. It is concluded that reclaimed rubbers of domestic serial tires are dielectrics, suitable for use in electro-insulating rubber (lines, cords, insulation, cables, footwear, etc.). There are 2 tables and 2 figures.

TITLE: **Conference on Methods Used in Correspondence Courses** (Metodicheskaya konferentsiya po zaochnomu obucheniyu)

PERIODICAL: Vestnik Vysshey Shkoly, 1957, # 10, 67-69 (USSR)

ABSTRACT: At the end of May of this year the first methodic conference on correspondence training took place at the Belorussian State University. General matters of correspondence training, the structure of lectures, the schedule of surveying and determining lectures were the subjects under discussion.

It was decided that lectures must not exceed 6 hours daily. Works submitted in writing were unsatisfactory, owing to low requirements of teachers and the overburdening of students with such work. The author proposes to eliminate this written work from certain disciplines.

The evaluation of the submitted works was stated to be unsatisfactory as some teachers limit their criticisms into a single phrase without any explanations. The methodics of diploma work, the selection of themes and the connection between student and teacher were dealt with.

Title : Preparation of timber by the cyclic method at the Lenles Lumber enterprises

Periodical : Mekh. Trud. Rab., 2, 11 - 15, March 1954

Abstract : Described is the cyclic (round the clock) method of preparing timber introduced and practiced by several large timber cutting groups belonging to the Soviet Lenles trust. The area designated for timber felling is divided into smaller sections which in turn are worked in shifts (at night by the light of reflectors mounted on the tractors) in accordance with earlier prepared technological charts. The gains obtained by applying this cyclic method are described.

AUTHOR: Babitskiy, G.M., Engineer

TITLE: The Experience in Mechanizing Operations at Enterprises of the "Lenles" Trust

PERIODICAL: Mekhanizatsiya i avtomatizatsiya proizvodstva, 1959, Nr 4, pp 32-34 (USSR)

ABSTRACT: The enterprises of the "Lenles" Trust are widely using advanced methods of loading big packs of topped crowns on rolling stock. At the Lodeynopol'skiy (Lodeynoye Pole) lespromkhoz, dug-in sloping masts with pulleys attached are used for loading crown packs, a tractor being used for power. At the Oyatskiy (Oyat') lespromkhoz growing trees are used instead of dug-in masts. The Kingiseppskiy (Kingisepp) lespromkhoz has introduced motor transport for taking out lumber, and big-package loading is accomplished by means of trailing winches type "TL-4". The Giprolestrans has developed a tractor mounted crane, type "TDT-40", with 2 winches for load and crane arm lifting. Two experimental models,

Card 1/3

SOV/118-59-4-11/25  
The Experience in Mechanizing Operations at Enterprises of the  
"Lenles" Trust

tested at the Lodeynoye Pole Lespromkhoz, proved superior to truck or K-7 tractor mounted cranes. At the Kapshinskiy (Kapsha) lespromkhoz, excavator-cranes type "E-505" have been used successfully for more than 3 years for unloading and stacking operations. The E-505 crane unloads from 12 to 13 cu m of lumber within 20 minutes or from 200 to 250 cu m per shift. The "Lenles" Trust has paid much attention to the technological improvement of operations and to the mechanization of lumber loading, especially the loading of short assortments into standard gage railway cars, using the UZhKP-1.5 and PK-6 cranes, elevator type loaders, electric winches, section conveyers and truck mounted loaders. Thus, the degree of mechanization has risen by 25 to 56% and, in certain lespromkhozes, such as the Dubovitskiy (Dubovik) and Podborovski (Podborov'ye), up to 90-95%. Based on experience gained at the Krestetskiy (Kresttsy) lespromkhoz, the Dubovik Lespromkhoz connected a

Card 2/3

The Experience in Mechanizing Operations at Enterprises of the  
"Lenles" Trust

section of the B-22 chain conveyer with 2 sections of the B-19 conveyer, thus forming a conveyer line 255 m in length. In 1958, the Dubovik Lespromkhoz produced 12,400 cu m of crating boards from low quality wood. Production per worker at the Dubovik Lespromkhoz amounted to 575 cu m in 1958. Due to the gasification of Leningrad's industry, the need for wood has sharply decreased. Therefore, the production of crating boards has been intensified by the enterprises of the "Lenles" Trust. There are 3 diagrams.

and Babitskiy, G.Sh., Engineer

TITLE: Efficient Selection of Braiding Equipment (Ratsional'nyy  
vybor opletochnogo oborudovaniya)

PERIODICAL: Vestnik Elektropromyshlennosti, 1958, Vol 29, Nr 5,  
pp 62-67 (USSR)

ABSTRACT: This article compares braiding machines in respect of their method of operation and their running costs. Braiding machines are classified into three main types: spindle machines, roundabout machines and knitting machines. The principles of the different machines are explained and Soviet and foreign types of each are named. The data on knitting machines are taken from foreign sources. Two main factors that govern the quality of braiding are constancy of thread tension and the dynamic factor. This latter is the product of the mass of those parts of the machine which move non-uniformly and their acceleration. The characteristics of the different types of the machines in respect of these two characteristics are discussed. Figures for the angular velocity of braiding machines are given in Table 1. A technical and economic analysis is then made of the main types of

110-58-5-21/25

The Efficient Selection of Braiding Equipment

machine and Table 2 gives the results of an analysis of production costs. It is concluded that compared with spindle machines roundabout machines are better, and show a cost of production of about a third. Contrary to the usual opinion, repair costs of spindle machines are very high. Knitting machines are then described and their principles of operation explained with reference to Figures 3 and 4. Knitting machines are apparently widely used abroad in various forms which are described. The advantages of knitting machines are summarised and it is concluded that they should be introduced into Soviet factories. Finally, the recommendations about selection of different types of machines for different kinds of work are recapitulated. There are 6 figures, 2 tables and 3 references, 1 of which is Soviet and 2 English.

no.3, 1962, 81-84

TEXT: A new method of dynamic vibration attenuation is proposed, based on the utilization of controlled electromagnetic interaction between the system to be damped and the vibration-absorbing element. The ordinary dynamic vibration absorber is distinguished by a critical sensitivity to the frequency of the exciting force. Nonlinear suspension of the dynamic vibration absorber reduces the sharpness of its tuning, but a broad frequency range cannot be achieved in this way quite apart from the difficulties in designing special nonlinear elements. Several configurations of electromagnetic assistance to the damping effect of the vibration absorber are illustrated. In all cases, the dynamic absorber mass is made in the form of a spool shaped core of magnetic material with a central neck. The core.

is free to move axially in the central hole of a pot electromagnet containing a coil placed in the recess of a ring of magnetic material having a channel section. In scheme A the core is linked to the main vibrating mass by a spring and the electromagnet is rigidly mounted ("earthed"). In scheme B the core is rigidly attached to the mass and the electromagnet is connected to earth by a spring. In scheme C the core is rigidly attached to the mass, and the electromagnet is free floating. In scheme D the core is rigidly attached to the mass and the electromagnet is attached to the same mass by a spring. The motion of these systems is described on the assumption that the current in the coil is constant. The electromagnetic effect is introduced by way of an equivalent elastic constraint depending on the design of the electromagnet and the magnitude of the coil current. Current control is an easy means of obtaining the desired attenuation in a wide frequency range. The amplitudes for the different schemes are formulated and the method of computing the equivalent stiffness is given. Numerical examples illustrate how the amplitude of oscillations can be limited at

TITLE: Calculation of vibro-shock modes of a pendulum with inertial suspension placed in a vibrating cavity

SOURCE: Ref. zh. Mekhanika, Abs. 9A121

REF SOURCE: Sb. Analiz i sintez mashin-avtomatov. M., Nauka, 1965, 20-30

TOPIC TAGS: shock propagation, dynamics, pendulum motion, vibration.

ABSTRACT: In the paper calculations are made of the boundaries of regions in the space of parameters of a two-mass system with clearance, which defines periodic vibro-shock modes. The dynamic model of the system consists of a cavity performing harmonic vibrations according to the law  $x_1 = a \cos \omega t$ , a suspension with mass  $M_2$  placed in the cavity with a clearance  $2r$ , and a pendulum of mass  $m_3$  attached to the suspension by a spring with linear characteristics and elasticity coefficient  $k$  and by a viscous damper with a coefficient proportional to  $c$ . On the basis of an electronic computer investigation of the dynamics of the system, regions are constructed for the existence of periodic vibro-shock modes. The stability analysis of the resulting periodic modes relative to small perturbations is fulfilled by means of an adaptation utilizing a finite difference method. Selected regions of

the stable modes within the region, where periodic modes exist, are also produced on an electronic computer. I. M. Aronzon [Translation of abstract] 0

TOPIC TAGS: mechanical engineering, mechanical engineering conference, machine vibration	
<p>ABSTRACT: The article reports on the proceedings at the Symposium on the Dynamics of Shock-Vibration Systems held on 22 December 1964 in Moscow under the auspices of the Institute of Machine Science at the State Committee on Machine Design, Gosplan USSR, and of the Academy of Sciences USSR. This symposium was convened by recommendation of the Scientific Council for Machine Theory, and about 150 scientists, engineers representing over 50 institutions and societies from the Moscow, Leningrad and Gor'kiy regions participated. Six comprehensive papers were presented and discussed dealing with the theoretical and experimental study of systems set in motion by impacts. Concerning the technical aspects of shock-vibration phenomena, much attention was devoted to the effectiveness of shock-damping of vibrations and to the utilization of this method in various types of structures ranging</p>

from airplanes to towers. Some undesirable aspects of shock condition in the performance of shaft bearings were also mentioned. The papers dealing with the theoretical analysis of shock-vibration systems dealt primarily with the feasibility of a uniform approach, namely with the geometric interpretation by the point mapping method. The application of analog and digital computers was emphasized, results of some dynamic model studies were presented, and the importance of shock-vibration systems to the theory of non-linear vibrations was discussed. At the conclusion of the meeting, a unanimous resolution was passed suggesting periodic conferences on these subjects in the future. [JPRS]

TITLE: The existence of <sup>2</sup>high frequency vibrations of large amplitude in linear systems with restraints

SOURCE: Mashinovedeniye, no. 1, 1966, 22-26

TOPIC TAGS: vibration analysis, high frequency

ABSTRACT: The article considers vibration shock conditions in linear vibrational systems with rigid restraints. A dynamic model of the system under consideration is shown in Fig. 1.

Card 1/3

UDC: 621.002.5

ACC NR: AP6016304

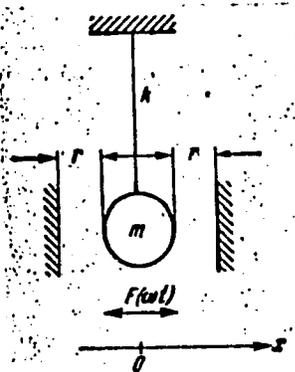

Figure 1.

The mass  $m$  is attached to an immovable base by an elastic element which has a linear characteristic with the coefficient  $k$ . The motion is limited by rigid supports which are equally distant from the static equilibrium position by a distance  $r$ . The mass is acted upon by a harmonic force with a frequency  $\omega$  and an amplitude  $F$ . To take account of the energy loss, it is assumed that the system is placed in a viscous medium with a damping coefficient  $c$ . It is natural that in this system there will be periodic motions without contact with the restraints. These motions are described by the linear differential equation:

$$m\ddot{x} + c\dot{x} + kx = F \cos \omega t, \quad (1)$$

Card 2/3

ACC NR: AP6016304

the periodic solution of which can be written in the dimensionless form in the following manner:

$$x = \frac{1}{\sigma} \cos(\tau + \varphi), \quad (2)$$

where

$$\frac{1}{\sigma} = \frac{\Phi}{\sqrt{\left(1 - \frac{1}{\zeta^2}\right)^2 + 4\frac{\eta^2}{\zeta^2}}, \quad \operatorname{tg} \varphi = \frac{2\eta}{\zeta\left(1 - \frac{1}{\zeta^2}\right)}$$

Здесь  $x = \frac{x}{r}, \quad \Phi = \frac{F}{rk}, \quad \zeta = \frac{p}{\omega}, \quad \eta = \frac{n}{p}, \quad p = \sqrt{\frac{k}{m}},$

$n = \frac{c}{2m}, \quad \tau = \omega t.$

Solution of Equation (2) will satisfy the system under consideration if

1. Mathematical solution of the problem demonstrates that the presence of rigid restraints brings about the danger of the appearance of vibrations of large amplitude in systems with a perturbation frequency considerably exceeding the resonance frequency of the damped system.

TITLE: Reaction of indium antimonide with AuIn<sub>2</sub>

SOURCE: AN SSSR. Izvestiya. Neorganichoskiye materialy, v. 3, no. 2, 1967, 311-314

TOPIC TAGS: indium compound, antimonide, gold compound, alloy phase diagram

ABSTRACT: Since, to the authors' knowledge, no one has ever studied the reaction of compounds having a sphalerite-type lattice with fluorite-type compounds, they undertook a study of the quasi-binary section InSb - AuIn<sub>2</sub> of the ternary system indium - antimony - gold, using differential thermal analysis (heating curves) and microstructural and x-ray phase analyses. The samples were prepared by zone leveling. A diagram of the quasi-binary section is shown in Fig. 1. A region of solid solutions from pure indium antimonide to an alloy with 10 mole % AuIn<sub>2</sub> was obtained by zone leveling. Solid solutions with AuIn<sub>2</sub> as the base were obtained by adding 5 mole % of InSb. It is thus shown that it is fundamentally possible to obtain solid solutions by reacting compounds with sphalerite and fluorite lattices. Orig. art. has: 3 figures and 2 tables.
